

The logo consists of a dark green square with the word "Freshli" written in a yellow, serif font.

Freshli User Guide

Team Members: Kyle Kim, Laura Tan, Jazmyn Zhang, Gia Xie

Public App URL: <https://foodies-dusky-pi.vercel.app>

1. Product Overview

Freshli is a mobile-first grocery tracking web app that helps households see what food is at home before it goes to waste. The app lets users sign in with Google, complete onboarding preferences, add items from receipt scans or manual input, track food by storage location, and browse recipes that use what is already available.

The UI images supplied for this guide show five major product areas: onboarding, add item, inventory management, recipe discovery, and profile/settings. Those flows are organized below in the same task order a first-time user would follow.

Home Dashboard

The home screen summarizes locations and urgent items at a glance.

Recipe Tab

Curated recipes, Magic Kitchen, and Collection are grouped together.

Profile / Settings

Impact metrics, food rules, notifications, and sign-out live here.

2. System Requirements

Category	Requirement
Supported platforms	Recommended on current Safari for iPhone/iPad and Chrome for Android. Desktop Chrome, Safari, or Edge can be used for review, but the UI is optimized for portrait mobile use.
Hardware	A camera-enabled phone or tablet is recommended for receipt scanning. Any device that can run a modern browser and upload clear photos is sufficient.
Internet	Freshli requires an internet connection for Google sign-in, Firebase sync, push notification setup, receipt parsing, and recipe recommendations.

Category	Requirement
Dependencies	End users do not install local packages. The app runs in the browser or as an installed PWA after visiting the public URL.
User accounts	A Google account is required. Camera, photo library, and notification permissions are optional but needed for the full experience.
Package contents	Not applicable. Freshli is a software-only product with no physical package components.

3. Installation and First-Time Setup

1. Open the production URL on a supported mobile browser. Install the PWA to the home screen if you want the app to behave like a native app.
2. Launch Freshli and sign in with Google.
3. Complete the onboarding questions so recipe and reminder behavior can be personalized.
4. Choose whether Freshli should notify you before items expire, then begin stocking the kitchen by scanning a receipt or typing items manually.

Brand entry screen.

Login
Google sign-in screen.

Home
At Home dashboard after setup.

Step 1 - Sign In

Google sign-in is the first required step.

Step 2 - Food Rules

Users select dietary preferences, allergies, and ingredient exclusions.

Step 3 - Notifications

Users choose when reminders should arrive.

Step 4 - Stock Up

Onboarding ends by guiding the user into the add-item flow.

4. Add Item Flow - Scan Receipt

The scan-based add-item flow is designed for fast inventory creation. Users photograph a receipt, wait for processing, then correct the result before saving it into inventory.

Capture Receipt

Take a clear photo of the full receipt.

Processing State

Freshli shows a processing screen while the receipt is analyzed.

Move Items

From scan results, a user can move items between fridge, freezer, and pantry.

Review and Save

The reviewed list can then be saved into inventory.

Scan editing and cleanup

Before saving, users can edit item details, delete bad detections, or switch to a bulk-selection mode for multi-item cleanup.

Swipe Actions

Swipe left on an item to expose Edit and Delete.

Bulk Edit

Enter bulk edit mode to select multiple items.

Bulk Actions

Selected items can be moved or deleted together.

Delete One

Single-item deletion requires confirmation.

Delete Many

Multi-item deletion also requires confirmation.

5. Add Item Flow - Manual Input

Manual input is available from the home-screen add sheet. It is useful for items bought without a receipt, leftovers, or when a scan result needs an extra item added by hand.

Add Sheet

The add button opens a sheet with Scan Receipt and Type It In options.

Blank Form

The user can start with an empty manual entry form.

Home Recipes Profile

Empty Home State

Even an empty kitchen state still exposes the add button for manual entry.

6. Inventory and Home Navigation

Freshli organizes saved items by location and urgency. The home screen highlights what should be used first, while the location pages support search, filters, sorting, and bulk maintenance.

Home Dashboard

Browse By Location and Use These First are the main inventory entry points.

Location Detail

Each location page supports category chips and item browsing.

Sort Options

Location detail supports sorting by expiry date or date added.

Location Switcher

Users can jump between fridge, freezer, and pantry counts.

Search and batch maintenance

Search Results

Search shows matching items grouped by storage location.

Cross-Location Search

The same query can return results in multiple locations.

Blank Search

The search screen starts empty until a query is entered.

Select Mode

Inventory supports multi-select actions from the location page.

Selected Items

Once selected, items are ready for move, used, or trash actions.

Move Selected

Batch-selected items can be moved between storage locations.

Item Detail

Each item detail page includes recipe prompts plus Used and Trash actions.

Item Detail Variant

A second captured state of the same detail flow was also provided.

7. Recipe Tab, Collection, and Magic Kitchen

The recipe experience has three connected areas: the curated recipe feed, the saved Collection page, and Magic Kitchen for more experimental ideas. Detailed recipe pages show timing, servings, ingredient matching, and step-by-step instructions.

Recipe Home

The main recipe page combines Magic Kitchen, Collection, category chips, and the curated feed.

Recipe Sorting

Users can sort recipes by most items used or by quickest.

Collection

Saved recipes live in a separate collection view.

Magic Kitchen Intro

Magic Kitchen starts with a dedicated landing page.

Curated Recipe Feed

A long-scroll version of the curated recipe list was provided for the guide.

Magic Kitchen Result

Magic Kitchen can generate a single bold concept recipe card.

Recipe Detail

Detailed recipe pages include description, ingredients, and steps.

Inventory-Aware Recipe Detail

A second recipe detail state shows ingredient availability such as In fridge or Unstocked.

Curated Feed Reference

Recipe cards show prep time, how many items are used, and whether a recipe is saved.

8. Settings and Impact Tracking

The profile area combines account details, waste-reduction impact metrics, food rules, collected recipes, notification settings, and sign-out. The supplied UI set also includes a modal that explains how impact is calculated for the current month.

Profile Settings

Users can open Food Rules, Collected Recipes, Notification, and Sign Out from one place.

Impact Explanation

The modal explains what 'items wasted' and 'estimated value saved' mean.

9. Technical Specifications

Application type: Progressive Web App built with React 19, TypeScript, Vite, and React Router.

Core modules: Login, onboarding, add-item flows, scan-result review, location inventory, recipe feed, Magic Kitchen, collection, item detail, and settings.

Data storage: Firebase Firestore stores receipts, items, user preferences, saved recipes, and item status fields such as active, used, or trashed.

Authentication: Google sign-in through Firebase Authentication and Google Identity Services.

Notifications: Firebase Cloud Messaging powers push notifications when browser and OS support them.

Receipt processing: Receipt images are analyzed through the app's AI-assisted parsing and verification pipeline before items are shown on the scan result screen.

Recipe integrations: Curated recipes and item-aware suggestions depend on live recommendation services and saved inventory data.

10. Data Privacy, Security, and Known Operational Limits

Personal data: Freshli stores signed-in identity, saved food items, recipe preferences, and notification settings in cloud services tied to the user's Google account.

Receipt handling: Users should only upload receipts they are comfortable sending through cloud-backed recognition and recommendation services.

Security warning: Sign out on shared devices. Push notifications may reveal that food is expiring, so users should enable them only on devices they control.

Operational warning: Expiry estimates are decision aids only. Users must still inspect food and follow package labels for food safety.

Platform limit: Some notification and login behaviors vary by browser. The UI and flows in this guide are clearly optimized for portrait mobile use.

11. Troubleshooting

Cannot sign in: confirm internet access and retry in Safari on iPhone/iPad or Chrome on Android.

Scan returns wrong items: retake the receipt photo in better lighting and clean up the result before saving.

Notifications do not arrive: check browser and device notification permissions. On iOS, install the app to the home screen first.

No recipes appear: make sure items are saved in inventory. Recipe results depend on live recommendation services.

Inventory looks outdated: wait for save actions to finish, then reopen or refresh the page once connectivity is stable.

12. Limitations

Scan quality still depends on the receipt photo. Wrinkles, blur, glare, and store-specific abbreviations can require manual correction.

The provided UI set contains a few repeated capture states. This guide keeps the repeated screens only when they help explain a distinct task or state change.

Magic Kitchen is intentionally experimental and may generate interesting but unconventional recipe ideas.

The repository did not include official instructor or sponsor metadata, so those cover-page fields are labeled transparently instead of being guessed.
